TITLE: Contactless pulse-type velocity transducer. Class 42, No. 186779

SOURCE: Izobretaniya, promyshlennyye obraztsy, tovarnyye znaki, no. 19, 1966, 106

TOPIC TAGS: speed regulator, <sup>acceleration</sup> velocity measuring instrument, velocity transducer

ABSTRACT: An Author Certificate has been issued for an ultrasonic oscillator with an automatic frequency control and a magnetostrictive transducer which serves as the load of the oscillator. The transducer is connected to a positive feedback circuit and is used as a selective element (see Fig. 1). To improve operational stability at the resonant frequency of the mechanical vibrating system, the passband multicircuit phase filter is connected to the positive feedback circuit of the oscillator. Orig. art. has: 1 figure.

KRAUKLIS, A. A. — "Influence of Thiamine on the Conditioned Reflex Activity of Animals." Acad Sci Latvian SSR, Inst of Experimental Medicine, 1952. In Latvian (Dissertation for the Degree of Candidate of Medical Sciences)

SO: Izvestiya Ak. Nauk Latvijskoy SSR, No. 9, Sept., 1955

Kranklis, A.

Influence of Bi-hypovitaminosis on the conditioned reflex activity of animals. A. Kranklis. *Latvijas PSR Zinātņu Akad. Vēstis* 1955, No. 9, 75-80 (in Russian).—  
Oral or parenteral (up to 5 mg.) administration of thiamine bromide (I) did not influence the defensive-motor conditioned reflexes (II) in rats. Parenterally given, 5 mg. I facilitated the reconditioning of the reflexes. In dogs and cats, 25-50 mg. I influenced the feeding-conditioned reflexes in different ways, depending on the type of the nervous system. In rats, slight Bi-hypovitaminosis (III) accelerated development, differentiation, and stabilization of II, but the reflexes were less stable. Under deeper III, II developed but did not stabilize. At very deep III, reflexes disappeared. III was accompanied by an increase in the pyruvic acid level in blood. A. Dravnicka

Orig Pub : Tr. In-ta eksperim. med. AN LatvSSR, 1956, 11, 171-185.  
Abstract : When during tests with 4 dogs continuous rhythmic stimuli (sound and light) were introduced, the following phenomena were observed: a decrease in the number of conditioned reactions between signals (RDS; motor-defensive), and a more precise and stronger time reflex. The slow rhythm of distance stimuli (a single stimulus every 10-30 seconds)

proved to be most effective, while fast rhythm (1-2 times per second) was least effective. When the rhythm was made slower during the test, a more precise reaction to time resulted; an acceleration of the rhythm caused an increase in the number of RBS. A prolonged application of distance stimuli contributed to the grouping of RBS as the rhythm was slowed down, and it also contributed to the timing of movement to a specific moment. -- K.S. Ratner.

Krauklis, A. A.

Self-regulation of higher nervous activity (Samoregulyatsiya vyschey nervnoy deyatel'nosti) Riga, Izd-vo AN LatSSR, 64. 0228 p. illus., bibliogr., fold. charts. (At head of title: Akademiya nauk Latviyskoy SSR. Akademiya meditsinskikh nauk SSSR. Latviyskiy institut eksperimental'noy i klinicheskoy meditsiny) Errata slip inserted. 1,500 copies printed.

TOPIC TAGS: nervous system, reflex activity, psychology, neurology

PURPOSE AND COVERAGE: The book examines the possible self-regulation physiological mechanism of higher-nervous activity in animals and humans. It is also a study on mechanism disorders which result from the inadequate behavior forms and inadequate improvement of internal organ functions. The book attempts to define some basic schemes of the nervous system self-regulation mechanisms (an area studied very little) inevitably connected with the expression of a series of controversial and hypothetical concepts. With the further development of physiology, psychology, and neuro-cybernetics the laws governing the self-regulation of the nervous activity will receive more mathematical expression. The purpose of this book is to increase the interest of physiologists, psychologists and doctors in the higher-nervous activity self-regulation problems, as well as in the development of new methods to

Card 1/3

L 50187-65

be used in the mathematical analysis of self-regulation laws.

AUTHOR: Krauklis, P.V. (Leningrad)

TITLE: Some low frequency oscillations of a liquid layer in  
an elastic medium

PERIODICAL: Prikladnaya matematika i mekhanika, v. 26, no. 6, 1962,  
1111 - 1115

TEXT: The author considers a liquid layer  $0 \leq z \leq h$  (in cylindrical coordinates,  $r, \theta, z$ ) denoted by the index 1, between two elastic half-spaces, denoted by the indices 0, 2. Each medium is characterized by longitudinal wave velocity  $1/a_i$ , transversal wave velocity  $1/b_i$  and density  $\rho_i$ . A wave source of dilatation center type is at the point  $(0, 0, -H)$ , its time dependence is a unit function. The potentials of elastic displacements are determined for the three media. At first parameters of the half-spaces are assumed to be equal. The characteristic equation corresponding to antisymmetric oscillations provides no low frequency oscillations with small velocity of propagation (which are the subject of the paper). The  
Card 1/2

Some low frequency oscillations of ... S/040/62/026/006/009/015  
D234/D308

characteristic equation of the symmetric case is  $L_2 = 0$ .  $L_2$  is approximately represented by

$$L_2 = \frac{2\omega^2 p_{01}}{kh} \left[ \gamma^2 + \frac{1 - \gamma_0^2}{p_{01}} kh \right]. \quad (4.2)$$

The dependence of phase and group velocity on frequency is

$$v = \left( \frac{1 - \gamma_0^2}{p_{10} b_0^2} \right)^{\frac{1}{2}} (kh)^{\frac{1}{2}} = \left( \frac{1 - \gamma_0^2}{p_{10} b_0^2} \right)^{\frac{1}{3}} (\omega h)^{\frac{1}{3}}, \quad u = \frac{3}{2} v. \quad (4.3)$$

A formula is given for the displacement vector. Corresponding equations are given for the case of unequal parameters of the two half-spaces without deduction. It is concluded that the attenuation is abnormally small.

TITLE Certain wave processes in media containing thin layers

SOURCE: AN SSSR. Institut fiziki Zemli. Geoakustika; ispol'zovaniye zvuka i ul'tra-zvuka v seismologii, seismorazvedke i gornom dele (Geoacoustics; the use of sound and ultrasound in seismology, seismic prospecting, and mining). Moscow, Izd-vu Nauka, 1966, 24-28

TOPIC TAGS: seismic modeling, seismic wave, wave propagation, head wave

ABSTRACT: Theoretical investigations of wave fields in seismic models containing a thin layer are briefly reviewed. The following are considered: free elastic model, elastic medium in a liquid, elastic medium in rigid or sliding contact with another elastic medium, and a liquid layer between elastic media. The effect of parameters of surrounding media and the type of boundary conditions on propagation of low-frequency waves along the layer is considered. The properties of head waves propagated along an elastic layer placed in a liquid are summarized. Orig. art. has: 6 formulas and 2 figures.

TITLE: The physical nature of some waves recorded during deep seismic sounding.  
2. Theoretical analysis of models of the earth's crust for regions of Central Asia

SOURCE: AN SSSR. Izv. Seriya geofizicheskaya, no. 1, 1964, 3-19

TOPIC TAGS: deep seismic sounding, earth's crust, Central Asia, head wave, reflected wave, refracted wave, kinematic characteristic, dynamic characteristic, Turkmenia, shot point, apparent wave velocity

ABSTRACT: The authors present results on theoretical comparisons of the kinematic and dynamic characteristics of the earth's crust in southeastern Turkmenia. They have considered possible laws governing changes in apparent wave velocity with distance from shot point in layered inhomogeneous media with plane-parallel interfaces. Three different models of the earth's crust were used, based on different velocity values, densities, rates of change with depth, and combinations of these. Results show that in layered, inhomogeneous media the following relations always hold for the different kinds of waves: for head waves  $dV^*/dx = 0$  and  $d^2V^*/dx^2 = 0$ ;

Card 1/3 2

ACCESSION NR: AP4014023

for reflected waves  $dV^*/dx < 0$  and  $d^2V^*/dx^2 > 0$ ; and for refracted waves, if  $dV^*/dx < 0$ ,  $d^2V^*/dx^2 > 0$ , but if  $dV^*/dx > 0$ , then either  $d^2V^*/dx^2 > 0$  or  $d^2V^*/dx^2 < 0$ . These relations may be used for control in the correlation of waves. From these results it follows, in particular, that there are no waves in inhomogeneous layered media for which the relations  $dV^*/dx < 0$  and  $d^2V^*/dx^2 < 0$  may be fulfilled simultaneously. Thus, in such inhomogeneous layered media, changes in apparent velocity of head, reflected, or refracted waves with increase in distance from shot point may take place according to but one of the laws illustrated in Fig. 1 on the Enclosure. Orig. art. has: 13 figures and 10 formulas.

TITLE: The physical nature of some waves recorded during deep seismic sounding. Comparison of theoretical computations with experimental data. 3

SOURCE: AN SSSR. Izv. "Seriya geofizicheskaya, no. 2, 1964, 184-195

TOPIC TAGS: seismic wave, deep seismic sounding, head wave, refracted wave, reflected wave, supercritical wave, "granite" layer, "basaltic" layer, wave group, Mohorovicic discontinuity

ABSTRACT: The authors have used theoretical computations and experimental data from two earlier papers (K voprosu o prirode voln, registriruyemykh pri GSZ, II. Teoreticheskiy analiz nekotorykh modeley zemnoy kory, Izv. AN SSSR, ser. geofiz., No. 1, 1964; K voprosu o prirode voln, registriruyemykh pri GSZ I. Kharakteristika eksperimental'nykh dannykh. Izv. AN SSSR, ser. geofiz., No. 11, 1963). They conclude that the first waves of the  $P_h^0$  group are head or weakly refracted waves,

Card 1/3

ACCESSION NR: AP4023372

corresponding to the upper part of the "granitic" layer. The wave group T( $P_*$ ) is a complex wave formation. The first wave of the group consists of a head (weakly refracted)  $P_*$  wave (up to a distance of 120-130 km from the shot point) and a supercritical reflected wave from the surface of the "granite" layer ( $P_1^0$  or  $P_1^{refl}$ ) or "basaltic" layer ( $P_*$   $refl$ ), depending on the relative thickness and velocity of the crustal layers. The  $P_1^{refl}$  and  $P_1^0$  waves are the supercritical reflected and head (weakly refracted) waves, respectively, corresponding to the subcrustal boundary (Mohorovicic discontinuity). The nature of the  $P_1$  wave group is not uniquely determined. It may represent a complex group of waves consisting of supercritical reflected and head waves formed at a discontinuity below the Mohorovicic discontinuity or refracted in the subcrustal layer (if it is assumed that velocity increases with depth in this layer). The  $P_1$  group, which is apparently recorded in other regions, may become the source of very valuable information on the structure of the upper part of the mantle. The principles of wave-group correlation in deep seismic sounding may lead to a combination of waves of different physical nature into a single group. To test correlation it is necessary to make preliminary

TITLE: Absolute effective cross sections in sensitized fluorescence of mercury and thallium vapors

SOURCE: Optika i spektroskopiya, v. 20, no. 3, 1966, 539-541

TOPIC TAGS: mercury, thallium, fluorescence, spectral line, line shift, optic transition

ABSTRACT: This is a continuation of an earlier experimental study (Opt. i spektr. v. 19, 154, 1965) of the absolute intensities of the spectral lines of thallium in sensitized fluorescence of mercury and thallium vapor. Present investigation is devoted to a different experimental condition, and to the calculation of the absolute effective cross sections on the basis of the obtained experimental measurements. The effective cross sections were determined by a formula given by one of the authors elsewhere (Kraulinya, with S. E. Frish, DAN SSR v. 101, 837, 1955 and other papers). Difficulties connected with the fact that the absolute

intensities vary from tube to tube, and the thallium spectrum is not simple but have a complicated structure, so that the hyperfine structure on the isotopic shift must be taken into account. A table listing the cross sections for various transitions with and without allowance for the hyperfine structure is presented. The results are compared with those by others and various differences are briefly discussed. The authors thank S. E. Frish for interest in the work, E.M. Anderson and E. K. Anderson for supplying the values of the transition probabilities for the thallium, and Yu. A. Silin' for help with the measurements. Orig. art. has: 1 formula and 1 table.

TITLE: Methods for producing a fiber from polyvinyl alcohol

PERIODICAL: Referativnyy zhurnal. Khimiya, no. 24 (II), 1962, 953,  
abstract 24P1034 (Pol. patent 44511, June 10, 1961)

TEXT: A method is described for the production of a fiber from polyvinyl alcohol by coagulation from aqueous solutions in a bath, dehydration and simultaneous stretching of the deposited fiber, removal of part of the salt contained in the fiber by washing, drying of the fiber, thermal treatment and acetalation. The method distinguishing features of this are as follows: the spinning solution flows from the spinneret into the coagulating bath at a velocity of 12 - 13 m/min. It then follows its course at an angle of 90°. The fiber leaves the coagulating bath at 15 m/min; there is a distance of 130 - 150 cm between the exit of the spinning solution from the spinneret and the point at which the fiber changes its direction in the bath. The excess from this bath is removed

Methods for producing a fiber from ...

and the fiber is passed through a washing bath which consists of an aqueous solution of sodium sulfate (concentration 140 - 155 g/l). The pH value of the spinning solution and coagulating bath is adjusted to 7 as to yield a spinning solution of polyvinyl alcohol containing <0.2% by weight of ashes. The maximum moisture of the dried fiber is 3% and the maximum drying temperature is 120°C. Before it is dried the fiber ought to contain 35-37% by weight of polyvinyl alcohol, 58 - 60% by weight of water, and 5-7% by weight of salt. The temperature of the washing bath is 25 - 29°C, the washing time of the fiber is ~1 min. [Abstracter's note: Complete translation.]

TITLE: Population inversion of energy levels of sodium in a mixture of vapors  
of sodium and mercury under optical pumping

SOURCE: Optika i spektroskopiya, v. 18, no. 5, 1965, 907-908

TOPIC TAGS: population inversion, sodium population inversion, sodium energy  
level

ABSTRACT: The population inversion produced by the 2537 Å line of a mercury vapor lamp with a power of  $10^{-2}$  w/cm<sup>3</sup> was experimentally investigated. The populations were determined according to the absolute line intensities of mercury and sodium. The intensities of the spectral lines were measured photoelectrically. A spherical tube 3-4 cm in diameter was used for the specimen. The measurement results are tabulated. Population inversion was observed in the 9S, 8D, 9P, 8P, and 7D levels, which suggests that negative absorption for a number of sodium infrared lines must occur on transitions from these levels to lower ones. The absorption coefficients were calculated on the assumption that the line widths were determined by the Doppler effect. The relatively low values of the absorption coefficients were attributed mainly to low pumping power. Orig. art. has: 1 table.
